

Post procedure instructions after crown and bridgework

- ☞ Sensitivity to cold and pressure is common for a few days after the dental procedure, usually deeper the cavity more sensitive the tooth will be.
- ☞ Many crowns fit below the gum line, because of that you may have some discomfort for a few days due to irritation of the gum during the procedure.
- ☞ Your temporary crown plays an important role in protecting your tooth and holding the space for your permanent crown or bridge.
- ☞ If the temporary crown comes off or loosens in between the appointment, please try to place it back with denture adhesive and call for an appointment.
- ☞ Avoid eating sticky foods and hard foods(caramel, chewing gum, hard candy) on the side of the mouth with a temporary crown.
